

windream BPM

The modern software solution for business process management

Generally, modern document management and archiving systems are nowadays not only used for administering documents. They can also contribute to control automatised business processes and to supervise complex business process structures. However, it is required to equip users with an adequate software with which they can generate and trace the processes efficiently. In this context, another important aspect is to combine DMS, archive and workflow system to one completely integrated product. This demand is exactly fulfilled by windream BPM, a brand new software developed by windream GmbH for modelling business processes.

Completely integrated

windream BPM enhances the windream document management and archiving system by a powerful and easy to handle application for tracing business processes. windream BPM – the letters stand for "Business Process Management" – allows windream users to generate, edit and supervise any business process. The new software solution cooperates seamlessly with the legally approved windream document management and archiving system.

Modern, powerful and flexible

windream BPM supports the processing of different process types. These are e.g. sequential and parallel processes as well as ad hoc workflows in which the workflow progress can be determined by users. Further on, it is also possible to generate subordinate processes as derivations of standard workflows.

- ◆ Easy modelling, editing and supervising of business processes
- ◆ Graphical forms designer
- ◆ Concise viewer for document reading
- ◆ Sequential and parallel editing of workflows; ad hoc workflows
- ◆ Specific user roles on the basis of windream users and groups

Forms and workflow designer

windream BPM provides a modern, graphical forms designer. Further features are a user-related work item list presented as a treeview, a viewer for document reading, a dialog for viewing the windream-specific document attributes including an optional function for filtering the document volumes according to the file properties, and a process-related presentation of the windream workflow forms.

A specific windream workflow designer is available for modelling business processes, which – among other features – provides a scripting interface and which even allows users to create versions of processes. Additionally, the workflow engine reacts dynamically on specific status changes.

Roles

User-specific roles can be started, supervised, answered for and edited. In this context, roles act as so called containers in the windream user administration. When taking a role, windream users can simultaneously be workflow users, too. The function of taking different roles for editing workflows can be transferred to all windream users which have been registered in the user administration as virtual groups.
